ConnectX®-5 VPI
100Gb/s InfiniBand & Ethernet Adapter Card

Intelligent RDMA-enabled network adapter card with advanced application offload capabilities for High-Performance Computing, Web2.0, Cloud and Storage platforms

ConnectX-5 with Virtual Protocol Interconnect® supports two ports of 100Gb/s InfiniBand and Ethernet connectivity, sub-600ns latency, and very high message rate, plus PCIe switch and NVMe over Fabric offloads, providing the highest performance and most flexible solution for the most demanding applications and markets: Machine Learning, Data Analytics, and more.

HPC ENVIRONMENTS

ConnectX-5 delivers high bandwidth, low latency, and high computation efficiency for high performance, data intensive and scalable compute and storage platforms. ConnectX-5 offers enhancements to HPC infrastructures by providing MPI and SHMEM/PGAS and Rendezvous Tag Matching offload, hardware support for out-of-order RDMA Write and Read operations, as well as additional Network Atomic and PCIe Atomic operations support.

ConnectX-5 VPI utilizes both IBTA RDMA (Remote Data Memory Access) and RoCE (RDMA over Converged Ethernet) technologies, delivering low-latency and high performance. ConnectX-5 enhances RDMA network capabilities by completing the Switch Adaptive-Routing capabilities and supporting data delivered out-of-order, while maintaining ordered completion semantics, providing multipath reliability and efficient support for all network topologies including DragonFly and DragonFly+.

ConnectX-5 also supports Burst Buffer offload for background checkpointing without interfering in the main CPU operations, and the innovative transport service Dynamic Connected Transport (DCT) to ensure extreme scalability for compute and storage systems.

STORAGE ENVIRONMENTS

NVMe storage devices are gaining popularity, offering very fast storage access. The evolving NVMe over Fabric (NVMeF) protocol leverages the RDMA connectivity for remote access. ConnectX-5 offers further enhancements by providing NVMe target offloads, enabling very efficient NVMe storage access with no CPU intervention, and thus improved performance and lower latency.

Moreover, the embedded PCIe switch enables customers to build standalone storage or Machine Learning appliances. As with the earlier generations of ConnectX adapters, standard block and file access protocols can leverage RoCE for high-performance storage access. A consolidated compute and storage network achieves significant cost-performance advantages over multi-fabric networks.

NEW FEATURES
- Tag Matching and Rendezvous Offloads
- Adaptive Routing on Reliable Transport
- Burst Buffer Offloads for Background Checkpointing
- NVMe over Fabric (NVMeF) Offloads
- Back-End Switch Elimination by Host Chaining
- Embedded PCIe Switch
- Enhanced vSwitch/vRouter Offloads
- Flexible Pipeline
- RoCE for Overlay Networks
- PCIe Gen 4 Support

BENEFITS
- Up to 100 Gb/s connectivity per port
- Industry-leading throughput, low latency, low CPU utilization and high message rate
- Maximizes data center ROI with Multi-Host technology
- Innovative rack design for storage and Machine Learning based on Host Chaining technology
- Smart interconnect for x86, Power, Arm, and GPU-based compute and storage platforms
- Advanced storage capabilities including NVMe over Fabric offloads
- Intelligent network adapter supporting flexible pipeline programmability
- Cutting-edge performance in virtualized networks including Network Function Virtualization (NFV)
- Enabler for efficient service chaining capabilities
- Efficient I/O consolidation, lowering data center costs and complexity
ConnectX-5 enables an innovative storage rack design, Host Chaining, by which different servers can interconnect directly without involving the Top of the Rack (ToR) switch. Alternatively, the Multi-Host technology that was first introduced with ConnectX-4 can be used. Mellanox Multi-Host™ technology, when enabled, allows multiple hosts to be connected into a single adapter by separating the PCIe interface into multiple and independent interfaces. With the various new rack design alternatives, ConnectX-5 lowers the total cost of ownership (TCO) in the data center by reducing CAPEX (cables, NICs, and switch port expenses), and by reducing OPEX by cutting down on switch port management and overall power usage.

**CLOUD AND WEB2.0 ENVIRONMENTS**

Cloud and Web2.0 customers that are developing their platforms on (Software Defined Network) SDN environments, are leveraging their servers’ Operating System Virtual-Switching capabilities to enable maximum flexibility.

Open V-Switch (OVS) is an example of a virtual switch that allows Virtual Machines to communicate with each other and with the outside world. Virtual switch traditionally resides in the hypervisor and switching is based on twelve-tuple matching on flows. The virtual switch or virtual router software-based solution is CPU intensive, affecting system performance and preventing fully utilizing available bandwidth.

Mellanox Accelerated Switching And Packet Processing (ASAP®) Direct technology allows to offload vSwitch/vRouter by handling the data plane in the NIC hardware while maintaining the control plane unmodified. As a results there is significantly higher vSwitch/vRouter performance without the associated CPU load.

The vSwitch/vRouter offload functions that are supported by ConnectX-5 include Overlay Networks (for example, VXLAN, NVGRE, MPLS, GENEVE, and NSH) headers’ encapsulation and de-capapsulation, as well as Stateless offloads of inner packets, packet headers’ re-write enabling NAT functionality, and more.

Moreover, the intelligent ConnectX-5 flexible pipeline capabilities, which include flexible parser and flexible match-action tables, can be programmed, which enable hardware offloads for future protocols. ConnectX-5 SR-IOV technology provides dedicated adapter resources and guaranteed isolation and protection for virtual machines (VMs) within the server. Moreover, with ConnectX-5 Network Function Virtualization (NFV), a VM can be used as a virtual appliance. With full data-path operations offloads as well as hairpin hardware capability and service chaining, data can be handled by the Virtual Appliance with minimum CPU utilization.
**FEATURES**

**InfiniBand**  
- EDR / FDR / ODR / DDR / SDR  
- IBTA Specification 1.3 compliant  
- RDMA, Send/Receive semantics  
- Hardware-based congestion control  
- Atomic operations  
- 16 million I/O channels  
- 256 to 4Kbyte MTU, 2Kbyte messages  
- 8 virtual lanes + VL15  
- Jumbo frame support (9.6KB)  

**Enhanced Features**  
- Hardware-based reliable transport  
- Collective operations offloads  
- Vector collective operations offloads  
- PeerDirect™ RDMA (aka GPUDirect®) communication acceleration  
- 64/66 encoding  
- Extended Reliable Connected transport (XRC)  
- Dynamically Connected transport (DCT)  
- Enhanced Atomic operations  
- Advanced memory mapping support, allowing user mode registration and remapping of memory (UMR)  
- On demand paging (ODP)  
- MPI Tag Matching  
- Rendezvous protocol offload  
- Out-of-order RDMA supporting Adaptive Routing  
- Burst buffer offload  
- In-Network Memory registration-free RDMA memory access  

**CPU Offloads**  
- RDMA over Converged Ethernet (RoCE)  
- TCP/UDP/IP stateless offload  
- LSO, LRO, checksum offload  
- RSS (also on encapsulated packet), TSS, HDS, VLAN and MPLS tag insertion / stripping, Receive flow steering  
- Data Plane Development Kit (DPDK) for kernel bypass applications  
- Open VSwitch (OVS) offload using ASAPI™  
- Flexible match-action flow tables  
- Tunneling encapsulation/decapsulation  
- Intelligent interrupt coalescence  
- Header rewrite supporting hardware offload of NAT router  

**Storage Offloads**  
- NVMe over Fabric offloads for target machine  
- Erasure Coding offload – offloading Reed Solomon calculations  
- T10 DIF – Signature handover operation at wire speed, for ingress and egress traffic  
- Storage protocols: SRP, iSER, NIFS RDMA, SMB Direct, NVMe  

**Overlay Networks**  
- RoCE over Overlay Networks  
- Stateless offloads for overlay network tunneling protocols  
- Hardware offload of encapsulation and decapsulation of VXLAN, NVGRE, and GENEVE overlay networks  
- SDN management interface for managing the eSwitch  
- PC interface for device control and configuration  
- General Purpose I/O pins  
- SPI interface to Flash  
- JTAG IEEE 1149.1 and IEEE 1149.6  

**HPC Software Libraries**  
- Open MPI, IBM PE, OSU MPI (MVAPICH/2), Intel MPI  
- Platform MPI, UPC, Open SHMEM  

**Management and Control**  
- NC-SI over MCTP over SMBus and NC-SI over MCTP over PCIe - Baseboard Management Controller interface  
- SDN management interface for managing the eSwitch  
- Virtualization hierarchies (e.g., NPAR and Multi-Host, when enabled)  
- Virtualizing Physical Functions on a physical port  
- SR-IOV on every Physical Function  
- Configurable and user-programmable QoS  
- Guaranteed QoS for VMs  

**Remote Boot**  
- Remote boot over InfiniBand  
- Remote boot over Ethernet  
- Remote boot over iSCSI  
- Unified Extensible Firmware Interface (UEFI)  
- Pre-execution Environment (PXE)  

* This section describes hardware features and capabilities. Please refer to the driver and firmware release notes for feature availability.
