Related Documents

The following table lists the documents referenced in this User Manual.

Table 2: Reference Documents

Document Name	Description
Mellanox OFED Linux Release Notes	Describes the new features and changes of the latest MLNX_OFED release.
Mellanox OFED Linux User Manual	Provides general information on the installation, configuration, management and maintenance of the software and hardware of VPI (InfiniBand, Ethernet) adapter cards.
Mellanox DPDK Release Notes	Describes the new features and changes of the latest Mellanox DPDK

1 Overview

Mellanox Poll Mode Driver (PMD) is designed for fast packet processing and low latency by providing kernel bypass for receive, send, and by avoiding the interrupt processing performance overhead.

This Quick Start Guide provides information of how to install and configure mlx4 and mlx5 DPDK Poll-Mode Driver (PMD) for Mellanox ConnectX®-3 Pro and ConnectX®-4/ConnectX®-4 Lx /ConnectX®-5/ConnectX®-5 Ex Ethernet adapters.

2 MLNX_DPDK Installation and Configuration

2.1 Installing ConnectX-3 Pro

2.1.1 MLNX_OFED/Firmware Versions

Table 3: MLNX_OFED/Firmware Versions

Driver/Firmware	Version	Download Link
MLNX_OFED	4.0-2.0.0.0 / 4.0-1.0.0.0 / 3.4-1.0.0.0 / 3.3-1.0.4.0	MLNX_OFED website
ConnectX-3 Pro Firmware	2.36.5000 and above	Firmware download page

2.1.2 ConnectX-3 Pro Bare Metal

1. Install MLNX_OFED. (See [Table 3: MLNX_OFED/Firmware Versions](#) for the Driver/Firmware versions)
2. Verify that ConnectX-3 Pro firmware is **2.36.5000 or above** (Use `ibstat` command).

Set all the ports to Ethernet, and follow the instructions on the screen.

```
connectx_port_config
```

For further instructions on how to run the script, please refer to the MLNX_OFED User Manual.

3. Add the following line to `/etc/modprobe.d/mlx4_core.conf`.

```
options mlx4_core log_num_mgm_entry_size=-7
```

NOTE: If VLAN filtering is used, set `log_num_mgm_entry_size=-1`.

NOTE: Please be aware, performance penalty can occur in this case.

4. Restart MLNX_OFED.

```
/etc/init.d/openib restart
```

5. Extract the package `MLNX_DPDK_16.11_2.3.tar.gz`

The default `mlx4` configuration in `config/common_linuxapp` is the following:

```
#
# Compile burst-oriented Mellanox ConnectX-3 (MLX4) PMD
#
CONFIG_RTE_LIBRTE_MLX4_PMD=y
CONFIG_RTE_LIBRTE_MLX4_DEBUG=n
CONFIG_RTE_LIBRTE_MLX4_SGE_WR_N=1
CONFIG_RTE_LIBRTE_MLX4_MAX_INLINE=0
CONFIG_RTE_LIBRTE_MLX4_TX_MP_CACHE=8
CONFIG_RTE_LIBRTE_MLX4_SOFT_COUNTERS=1
```

6. Compile DPDK.

```
On x86_64:
```

```
make install T=x86_64-native-linuxapp-gcc
on Power8:
make install T=ppc_64-power8-linuxapp-gcc
```

For more advanced DPDK compilation options, please refer to dpdk.org documentation:

http://www.dpdk.org/doc/guides/linux_gsg/index.html

7. Configure huge pages according to the NUMA the card is connected to

```
echo $PAGE_NUM >
/sys/devices/system/node/node$NUMA_NODE/hugepages/hugepages-
"$PAGE_SIZE"kB/nr_hugepages

mkdir -p /mnt/huge

HTLB_MOUNTED=$( mount | grep "type hugetlbfs" | wc -l)
if [ $HTLB_MOUNTED -eq 0 ]; then
    mount -t hugetlbfs hugetlb /mnt/huge
fi
```

2.1.3 ConnectX-3 Pro KVM

2.1.3.1 MLNX_OFED/Firmware Versions

Table 4: MLNX_OFED/Firmware Versions

Driver/Firmware	Version	Download Link
MLNX_OFED	4.0-2.0.0.0 / 4.0-1.0.0.0 3.3-1.0.4.0 / 3.4-1.0.0.0	MLNX_OFED website
ConnectX-3 Firmware	2.36.5000 and above	Firmware download page
ConnectX-3 Pro Firmware	2.36.5000 and above	Firmware download page

2.1.3.2 ConnectX-3 Pro KVM Hypervisor

1. Download MLNX_OFED. (See [Table 4: MLNX_OFED/Firmware Versions](#) for the Driver/Firmware versions)
2. Install MLNX_OFED enable SR-IOV.
3. Please follow MLNX_OFED User Manual instructions how to enable SR-IOV.
4. Verify that ConnectX-3 Pro firmware is **2.36.5000 or above** (Use `ibstat` command).
5. Add the following line to `/etc/modprobe.d/mlx4_core.conf`.

```
options mlx4_core log_num_mgm_entry_size=-7
```

NOTE: If VLAN filtering is used, set `log_num_mgm_entry_size=-1`.

Please be aware, performance penalty can occur in this case.

6. Restart MLNX_OFED.

```
/etc/init.d/openibd restart
```

2.1.3.3 ConnectX-3 Pro KVM Virtual Machine

1. Download MLNX_OFED. (See [Table 4: MLNX_OFED/Firmware Versions](#) for the Driver/Firmware versions)
2. Install MLNX_OFED and enable the guest.

```
./mlnxofedinstall --guest
```

3. Extract the package MLNX_DPDK_16.11_2.3.tar.gz

The default mlx4 configuration in config/common_linuxapp is the following:

```
#
# Compile burst-oriented Mellanox ConnectX-3 (MLX4) PMD
#
CONFIG_RTE_LIBRTE_MLX4_PMD=y
CONFIG_RTE_LIBRTE_MLX4_DEBUG=n
CONFIG_RTE_LIBRTE_MLX4_SGE_WR_N=1
CONFIG_RTE_LIBRTE_MLX4_MAX_INLINE=0
CONFIG_RTE_LIBRTE_MLX4_TX_MP_CACHE=8
CONFIG_RTE_LIBRTE_MLX4_SOFT_COUNTERS=1
```

4. Compile DPDK.

```
On x86_64:
make install T=x86_64-native-linuxapp-gcc
on Power8:
make install T=ppc_64-power8-linuxapp-gcc
```

For more advanced DPDK compilation options, please refer to dpdk.org documentation:

http://www.dpdk.org/doc/guides/linux_gsg/index.html

5. Configure huge pages.

```
echo $PAGE_NUM > /sys/devices/system/node/node0/hugepages/hugepages-
"$PAGE_SIZE"kB/nr_hugepages

mkdir -p /mnt/huge

HTLB_MOUNTED=$( mount | grep "type hugetlbfs" | wc -l)
if [ $HTLB_MOUNTED -eq 0 ]; then
    mount -t hugetlbfs hugetlb /mnt/huge
fi
```

2.2 Installing ConnectX-4/ConnectX-4 Lx /ConnectX-5

2.2.1 MLNX_OFED/Firmware Versions

Table 5: MLNX_OFED/Firmware Versions

Driver/Firmware	Version	Download Link
MLNX_OFED	4.0-2.0.0.0	MLNX_OFED website
ConnectX-4 Firmware	12.18.2000	Firmware download page
ConnectX-4 Lx Firmware	14.18.2000	Firmware download page
ConnectX-5 Firmware	16.19.1200	Firmware download page

MLNX_OFED version that support Software Parser (to support TX offload for VXLAN packets without Ethernet header) is MLNX_OFED: 4.0-2.0.0.1.1.

2.2.2 ConnectX-4/ConnectX-4 Lx /ConnectX-5 Bare Metal

➤ *To clean installation or upgrade from any previous MLNX_DPDK GA version:*

1. Download MLNX_OFED. (See [Table 5: MLNX_OFED/Firmware Versions](#) for the Drivers/Firmware versions)

2. Install the MLNX_OFED driver.

```
./mlnxofedinstall
```

3. Verify that ConnectX-4 firmware is 12.18.2000, ConnectX-4 Lx firmware is 14.18.2000 and ConnectX-5 firmware is 16.19.1200

```
ibv_devinfo
```

4. Set all the ports to Ethernet if MLNX_OFED has been installed

```
mst start
```

```
mlxconfig -d <device> set LINK_TYPE_P1/2=1/2/3
* LINK_TYPE_P1=<1|2|3> , 1=Infiniband 2=Ethernet 3=VPI(auto-sense)
```

For example:

```
mlxconfig -d /dev/mst/mt4115_pciconf0 set LINK_TYPE_P1=2
```

```
mlxfwreset -d <device> reset
```

For further instructions on how to run the script, please refer to the MLNX_OFED User Manual.

5. Restart the driver:

```
/etc/init.d/openibd restart
```

6. Extract the package MLNX_DPDK_16.11_2.3.tar.gz

The default mlx5 configuration in config/common_base is the following:

```
# Compile burst-oriented Mellanox ConnectX-4 (MLX5) PMD
#
CONFIG_RTE_LIBRTE_MLX5_PMD=y
CONFIG_RTE_LIBRTE_MLX5_DEBUG=n
CONFIG_RTE_LIBRTE_MLX5_TX_MP_CACHE=8
```

7. Compile DPDK.

```
On x86_64:
make install T=x86_64-native-linuxapp-gcc
```

```
on Power8:
make install T=ppc_64-power8-linuxapp-gcc
```

For more advanced DPDK compilation options, please refer to [dpdk.org](http://www.dpdk.org/doc/guides-16.11/) documentation:

<http://www.dpdk.org/doc/guides-16.11/>

- Configure huge pages according to the NUMA the card is connected to.

```
echo $PAGE_NUM >
/sys/devices/system/node/node$NUMA_NODE/hugepages/hugepages-
"$PAGE_SIZE"kB/nr_hugepages

mkdir -p /mnt/huge

HTLB_MOUNTED=$( mount | grep "type hugetlbfs" | wc -l)
if [ $HTLB_MOUNTED -eq 0 ]; then
    mount -t hugetlbfs hugetlb /mnt/huge
fi
```

2.2.3 ConnectX-4/ConnectX-4 Lx / ConnectX-5 KVM

2.2.3.1 MLNX_OFED/Firmware Versions

Table 6: MLNX_OFED/MLNX_EN/Firmware Versions

Driver/Firmware	Version	Download Link
MLNX_OFED	4.0-1.0.1.0	MLNX_OFED website
ConnectX-4 Firmware	12.18.2000	Firmware download page
ConnectX-4 Lx Firmware	14.18.2000	Firmware download page
ConnectX-5 Firmware	16.19.1200	Firmware download page

2.2.3.2 ConnectX-4/ConnectX-4 Lx /ConnectX-5 KVM Hypervisor

- Download MLNX_OFED. (See [Table 5: MLNX_OFED/Firmware Versions](#) for the Drivers/Firmware versions)
- Install the MLNX_OFED driver.

```
./mlnxofedinstall
```

- Restart the driver.

```
/etc/init.d/openibd restart
```

- Verify that ConnectX-4 firmware is 12.18.2000, ConnectX-4 Lx firmware is 14.18.2000 and ConnectX-5 firmware is 16.19.1200

```
ibv_devinfo
```

- Check if SR-IOV is enabled in the firmware.

```
mlxconfig -d /dev/mst/mt4113_pciconf0 q
Device #1: -----
Device type: Connect4
PCI device: /dev/mst/mt4115_pciconf0
Configurations: Current
SRIOV_EN 1
NUM_OF_VFS 8
```

- If needed, use `mlxconfig` to set the relevant fields:

```
mlxconfig -d /dev/mst/mt4113_pciconf0 set SRIOV_EN=1 NUM_OF_VFS=16
mlxfwreset -d <device> reset
```

- Set all the ports to Ethernet.

```
mst start
mlxconfig -d <device> set LINK_TYPE_P1/2=1/2/3
* LINK_TYPE_P1=<1|2|3> , 1=Infiniband 2=Ethernet 3=VPI(auto-sense)
For example:
mlxconfig -d /dev/mst/mt4115_pciconf0 set LINK_TYPE_P1=2
mlxfwreset -d <device> reset
```

For further instructions on how to run the script, please refer to the MLNX_OFED User Manual.

- Write to the sysfs file the number of Virtual Functions you need to create for the PF.

The following is an example of a standard Linux kernel generated file that is available in the new kernels.

```
echo [num_vfs] > /sys/class/infiniband/mlx5_0/device/sriov_numvfs
```

For further information, please refer to the MLNX_OFED User Manual section "Configuring SR-IOV for ConnectX-4/Connect-IB".

2.2.3.3 ConnectX-4/ConnectX-4 Lx/ConnectX-5 KVM Virtual Machine

- Download MLNX_OFED. ([See Table 6: MLNX_OFED/MLNX_EN/Firmware Versions](#) for the Drivers/Firmware versions)
- Install the MLNX_OFED driver.

```
./mlnxofedinstall
```

- Extract the package MLNX_DPDK-16.11_2.3.tar.gz

The default mlx5 configuration in config/common_base is the following:

```
#
# Compile burst-oriented Mellanox ConnectX-4 (MLX5) PMD
#
CONFIG_RTE_LIBRTE_MLX5_PMD=y
CONFIG_RTE_LIBRTE_MLX5_DEBUG=n
CONFIG_RTE_LIBRTE_MLX5_TX_MP_CACHE=8
```

- Compile DPDK.

```
On x86_64:
make install T=x86_64-native-linuxapp-gcc
on Power8:
make install T=ppc_64-power8-linuxapp-gcc
```

For more advanced DPDK compilation options, please refer to dppk.org documentation:

<http://www.dpdk.org/doc/guides-16.11/>

- Configure huge pages.

```
echo $PAGE_NUM > /sys/devices/system/node/node0/hugepages/hugepages-
"$PAGE_SIZE"kB/nr_hugepages

mkdir -p /mnt/huge

HTLB_MOUNTED=$( mount | grep "type hugetlbfs" | wc -l)
if [ $HTLB_MOUNTED -eq 0 ]; then
    mount -t hugetlbfs hugetlb /mnt/huge
fi
```

2.2.4 ConnectX-4/ConnectX-4 Lx ESX6.0 UP1

2.2.4.1 Firmware Versions

Table 7: Firmware Versions

Driver/Firmware	Version	Download Link
ConnectX-4 Firmware	12.17.1010	Firmware download page
ConnectX-4 Lx Firmware	14.17.1010	Firmware download page

2.2.4.2 ConnectX-4/ConnectX-4 Lx ESXi: VMware

1. Download MLNX-NATIVE-ESX-ConnectX-4.

http://www.mellanox.com/page/products_dyn?product_family=29&mtag=vmware_driver

2. Install MLNX-NATIVE-ESX-ConnectX-4 v4.15.6.22 for ESX 6.0.

```
esxcli software vib install -d /FULL_PATH/<VERSION>.zip
```

3. Update the firmware on ESXi.

4. Verify that ConnectX-4 firmware is 12.17.1010 and ConnectX-4 Lx firmware is 14.17.1010.

ConnectX-4:

```
/opt/mellanox/bin/mlxburn -d mt4115_pciconf0 -fw_dir /FULL_PATH/fw-4115-rel-12_17_1010for ConnectX-4
```

ConnectX-4 Lx:

```
/opt/mellanox/bin/mlxburn -d mt4115_pciconf0 -fw_dir /FULL_PATH/fw-4117-rel-14_17_1010
```

5. Verify that NIC firmware is burned as expected:

```
/opt/mellanox/bin/flint -d mt4115_pciconf0 q
```

6. Reboot the ESXi machine.

7. Enable SR-IOV on the VMware.

```
esxcli system module parameters set -m nmlx5_core -p max_vfs=2
esxcfg-module -g nmlx5_core
```

8. Restart the driver.

```
/opt/mellanox/bin/openibd restart
```

2.2.4.3 ConnectX-4/ConnectX-4 Lx ESXi: VM Virtual Machine

1. Download MLNX_OFED/. (See [Table 6: MLNX_OFED/MLNX_EN/Firmware Versions](#) for the Driver/Firmware versions)

2. Install the MLNX_OFED driver.

```
./mlnxofedinstall
```

3. Extract the package MLNX_DPDK-16.11_2.3.tar.gz

The default mlx5 configuration in config/common_base is the following:

```
#
# Compile burst-oriented Mellanox ConnectX-4 (MLX5) PMD
#
CONFIG_RTE_LIBRTE_MLX5_PMD=y
CONFIG_RTE_LIBRTE_MLX5_DEBUG=n
```

```
CONFIG_RTE_LIBRTE_MLX5_TX_MP_CACHE=8
```

4. Compile DPDK.

```
make install T=x86_64-native-linuxapp-gcc
```

For more advanced DPDK compilation options, please refer to [dpdk.org](http://www.dpdk.org/doc/guides-16.11/) documentation: <http://www.dpdk.org/doc/guides-16.11/>

5. Configure huge pages.

```
echo $PAGE_NUM > /sys/devices/system/node/node0/hugepages/hugepages-
"$PAGE_SIZE"kB/nr_hugepages
```

```
mkdir -p /mnt/huge
```

```
HTLB_MOUNTED=$( mount | grep "type hugetlbfs" | wc -l)
if [ $HTLB_MOUNTED -eq 0 ]; then
    mount -t hugetlbfs hugetlb /mnt/huge
fi
```

2.3 Configuring PMD Debug Mode

➤ To enable Debug mode:

1. Modify the `config/common_base` file.

- `CONFIG_RTE_LOG_LEVEL=RTE_LOG_DEBUG`
- For `mlx4` PMD: `CONFIG_RTE_LIBRTE_MLX4_DEBUG=y`
- For `mlx5` PMD: `CONFIG_RTE_LIBRTE_MLX5_DEBUG=y`

2. Compile DPDK.

```
On x86_64:
rm -rf x86_64-native-linuxapp-gcc
make install T=x86_64-native-linuxapp-gcc
On Power8:
rm -rf ppc_64-power8-linuxapp-gcc
make install T=ppc_64-power8-linuxapp-gcc
```

3. Add `--log-level=9` to EAL command line parameters when you run your application.

2.4 mlx5 PMD Command Line Parameters

Parameter	Description
txq_inline_auto_en	<p>[Beta] This mode is disabled by default and supported only on ConnectX-4 single port card. It should not be used to measure 0 packet loss performance.</p> <p>When enabled, the running algorithm for auto inline is:</p> <ul style="list-style-type: none"> The PPS is measured with and without inline, and the decision is taken according to the highest PPC. After the decision was taken, every 100 ms of the packet rate is tested and if there was 10% change in the packet rate, the measurements with and without inline are done again. <p>It is expected that at the beginning of the test the performance will not be at maximum, but after 1 sec, the performance should be stabilized.</p> <p>When enabled, txq_inline option is ignored.</p>
txq_inline	<p>Amount of data to be inlined during TX operations. This improves latency. It can improve PPS performance when PCI back pressure is detected and may be useful for scenarios involving heavy traffic on many queues.</p> <p>On ConnectX-4: It is recommended to set it to 128 for messages $\leq 128B$ and to set it to 64 for messages $> 128B$</p> <p>On ConnectX-4 Lx: When is used with txq_mpw_en option (see below), in case of PCI back pressure, it is recommended to set to 200</p> <p>On ConnectX-5: It is set to 896 by default if Enhanced MPW is enabled. If not, it is disabled by default (set to 0) since the additional software logic necessary to handle this mode can lower performance when back pressure is not expected. (see below explanation regarding Enhanced MPW)</p>
txqs_min_inline	<p>Enable inline Send only when the number of TX queues is higher or equal to this value. This option should be used in combination with txq_inline above.</p> <p>It is set to 8 by default only if Enhanced MPW is enabled. If not, it is set to zero by default.</p>
txq_mpw_en	<p>When set to 1 MPW/Enhanced MPW is enabled When set to 0 MPW is disabled</p> <p>This option is to enable multi-packet send. This feature allows the TX burst function to pack up to multiple packets in a single descriptor session in order to save PCI bandwidth.</p> <p>MPW is enabled for ConnectX-4 Lx and Enhanced MPW is enabled for ConnectX-5.</p> <p>A MPW session can carry only identical size of packets and the number of packets in a session is also limited while Enhanced MPW does not have such limitations.</p> <p>When txq_inline is set along with this option, TX burst function tries to copy entire packet data on to TX descriptor instead of including pointer of packet only if there is enough room remained in the descriptor. txq_inline sets per-descriptor space for either pointers or inlined packets. Enhanced MPW supports hybrid mode - mixing inlined packets and pointers in a descriptor.</p> <p>This option cannot be used in conjunction with tso. When tso is set, txq_mpw_en is disabled.</p> <p>It is set to 1 by default.</p> <p>To disable please set to 0.</p>

Parameter	Description
	When multi-packet send is enabled, there is no support for TX VLAN HW insertion. To use TX VLAN HW insertion please disable it.
txq_mpw_hdr_dseg_en	Enables including two pointers in the first block of TX descriptor. This can be used to lessen CPU load for memory copy. Effective only when Enhanced MPW is supported. Disabled by default.
txq_max_inline_len	Maximum size of packet to be inlined. This option limits the size of packet to be inlined. If the size of a packet is larger than configured value, the packet isn't inlined even though there's enough space remained in the descriptor. Instead, the packet is included with pointer. Effective only when Enhanced MPW is supported. The default value is 256.
tso	Enables hardware TSO. When hardware TSO is enabled, packets marked with TCP segmentation offload will be divided into segments by the hardware. It is disabled by default.
rxq_cqe_comp_en	A nonzero value that enables optimized received packets' completion algorithm when PCI back pressure is detected. This improves performance at the cost of a slightly higher CPU usage. It is enabled by default. To disable this please set to 0
udp_port	A nonzero value enables traffic dispatching between the kernel and DPDK according to the packet UDP port. UDP packets with destination port equals to udp_port will be directed to DPDK. RSS will be support for those packets, the RSS configuration must be ETH_RSS_UDP.

2.5 Checksum and TSO offload for VXLAN Packets without the Inner Ethernet Header on ConnectX4/ConnectX-4 Lx

The feature provides the ability for HW to compute the checksums and segment non-standard VXLAN packets which do not contain the inner Ethernet header.

2.5.1 System Requirements

- Must run on PF
- Must have MLNX_OFED version which supports Software Parser installed:
MLNX_OFED:4.0-2.0.0.1.1

2.5.2 Command Line Requirements

- For ConnectX-4 Lx, force `txq_mpw_en=0`
- If TSO is required, set `tso=1`

2.5.2.1 Using Checksum and TSO offload for VXLAN Packets without the Inner Ethernet Header on ConnectX4/ConnectX-4 Lx

➤ *To use the feature, the application should:*

1. Prepare mbuf to send with the non-standard VXLAN packet
2. Set `PKT_TX_TUNNEL_VXLAN` on the mbuf
3. Fill all mbuf header length fields correctly
4. Set the checksum and TSO flags according to the application needs.

2.6 Sending and Receiving Jumbo Frames on ConnectX-3 Pro

If the mbuf size is smaller than the MTU size and you need to use scattered mbuf.

1. Modify the `config/common_base` file.
 - For ConnectX-3 PMD: `CONFIG_RTE_LIBRTE_MLX4_SGE_WR_N=4`
2. Compile DPDK.

```
On x86_64:
rm -rf x86_64-native-linuxapp-gcc
make install T=x86_64-native-linuxapp-gcc
On Power8:
rm -rf ppc_64-power8-linuxapp-gcc
make install T=ppc_64-power8-linuxapp-gcc
```

3. Set the appropriate MTU using the `rte_eth_dev_set_mtu` API.

2.7 Setting RX VLAN Filter on ConnectX-3 Pro

Make sure that regular steering mode is configured.

```
cat /sys/module/mlx4_core/parameters/log_num_mgm_entry_size -1
```

5. Modify the `/etc/modprob.d/mlnx.conf` file if required and restart MLNX_OFED.
Configure VLAN interface on the port using standard Linux tools.

6. Add or remove VLAN using the `rte_eth_dev_vlan_filter()` DPDK API.

3 System Performance Configuration

3.1 General Settings

- Use server with at least 4 memory channels, for better performance. In order to check the number of memory channels use:

```
# lshw -C memory
```

The output will show the server banks with their utilization

```
*-bank:1
  description: DIMM Synchronous 2400 MHz (0.4 ns)
  product: 18ASF2G72PDZ-2G3B1
  vendor: 002C00B3002C
  physical id: 1
  serial: 15B8ED61
  slot: A2
  size: 16GiB
  width: 64 bits
  clock: 2400MHz (0.4ns)
*-bank:2
  description: [empty]
  physical id: 2
  slot: A3
```

- Use the CPU near local NUMA node to which the PCIe adapter is connected, for better performance.

For Virtual Machines (VM), verify that the right CPU and NUMA node are pinned for the VM according to the above. If possible, connect you NIC near NUMA node 0. Run `mst status -v` to identify the NUMA node to which the PCIe adapter is connected

```
mst status -v
MST modules:
-----
  MST PCI module loaded
  MST PCI configuration module loaded
PCI devices:
-----
DEVICE_TYPE          MST          PCI          RDMA
NET
ConnectX3Pro(rev:0)  /dev/mst/mt4103_pciconf0
ConnectX3Pro(rev:0)  /dev/mst/mt4103_pci_cr0    04:00.0    mlx4_0
net-eth4,net-eth5
```

- If more than one adapter is used, verify that both adapters are located on the same PCI bus (as each CPU socket on a Crown Pass platform manages its own PCI bus) in order to forward packets from one to the other without NUMA performance penalty.

- **Check the Core Frequency**

Check that the output CPU frequency for each core is equal to the maximum supported and that all core frequencies are consistent.

- Check the maximum supported CPU frequency:

```
#cat /sys/devices/system/cpu/cpu*/cpufreq/cpuinfo_max_freq
```

- Check that the core frequencies are consistent

```
#cat /proc/cpuinfo | grep "cpu MHz"
```

- Check that the output frequencies are the same as the maximum supported

- Check the current CPU frequency to check whether it is configured to max available frequency:

```
#cat /sys/devices/system/cpu/cpu*/cpufreq/cpuinfo_cur_freq
```

When the following CPU frequency modules are loaded, CPU scaling is enabled, and you can improve performance by setting the scaling mode to performance:

- **Set the scaling mode to performance for every CPU**

```
# echo performance >
/sys/devices/system/cpu/cpu<cpunumber>/cpufreq/scaling_governor
```

For further information, please refer to Performance Tuning Guide for Mellanox Adapters

(http://www.mellanox.com/related-docs/prod_software/Performance_Tuning_Guide_for_Mellanox_Network_Adapters.pdf)

- **Verify that Max_Read_Req BIOS parameter is set to 1K**

To obtain the current setting for the Max_Read_Req BIOS parameter:

```
setpci -s <NIC BIOS address> 68.w
```

```
example:
setpci -s 21:00.0 68.w
3026
```

If the output is different than 3XXX, set it by:

```
setpci -s <NIC BIOS address> 68.w=3XXX
```

NOTE: The XXX can be different on different systems. Make sure to configure according to the setpci output..

For example:

```
setpci -s 84:00.0 68.w
2026
Run: setpci -s 84:00.0 68.w=3026
```

- **Disable pause frames on all network interfaces managed by mlx4_en/mlx5_en**

```
lldpad stop
```

```
ethtool -A eth16 rx off tx off
```

NOTE: In certain systems, pause frames are used to increase performance.

- **Use 1Gb huge pages**

- **Hyper threading**

In certain DPDK application, enabling hyper threading results in better performance. For benchmarking purposes, it is recommended to disable hyper threading

- **Make sure that unnecessary System Management Interrupts (SMIs) are disabled**
SMI that are used for Power Monitoring and for Memory PreFailure Notification are recommended to be disabled. Please refer to your server provider guides for recommended platform tuning.

- **Isolate used cores**

Use `isolcpus` command for boot configuration.

For example, add the following to kernel boot parameters:

```
isolcpus=2,3
```

- **Disable kernel memory compaction**

```
echo never > /sys/kernel/mm/transparent_hugepage/defrag
echo never > /sys/kernel/mm/transparent_hugepage/enabled
echo 0 > /sys/kernel/mm/transparent_hugepage/khugepaged/defrag
sysctl -w vm.swappiness=0
sysctl -w vm.zone_reclaim_mode=0
```

- **Interrupts configuration**

NOTE: Interrupts configuration should be performed only if the needed performance was not achieved.

- Stop irqbalancer

```
service irqbalance stop
```

- Set all possible interrupts to different NUMA:

```
Example: echo '6-9' | sudo tee /proc/irq/*/smp_affinity_list
```

- Set NIC interrupts to same NUMA:

Example:

```
set_irq_affinity_cpulist.sh 0-1 ethX
```

- Set other NIC interrupts to different NUMA:

Example:

```
set_irq_affinity_cpulist.sh 6-9 ethY
```

- **IO non-posted prefetch settings**

Verify IO non-posted prefetch is disabled by default. This can be checked via the BIOS configuration.

Please contact your server provider for more information about the settings.

3.1.1 ConnectX-3 Pro Setting

- Verify the optimized steering mode is configured

```
cat /sys/module/mlx4_core/parameters/log_num_mgm_entry_size -7
```

If not, modify `/etc/modprobe.d/mlx4_core.conf` and restart `MLNX_OFED`

- Use environment variable `MLX4_INLINE_RECV_SIZE=64` to get maximum performance for 64B messages

Example:

```
MLX4_INLINE_RECV_SIZE=64 ./testpmd -c 0xe000 -n 4 --socket-mem=0,2048 --
--port-numa-config=0,1,1,1 --socket-num=1 --burst=64 --txd=256 --rxd=256
--mbcache=512 --rxq=1 --txq=1 --nb-cores=2 --i
```

3.1.2 ConnectX-4 / ConnectX-4 Lx / ConnectX-5 Settings

- Configure aggressive CQE Zipping for maximum performance

```
mlxconfig -d mlx5_0 s CQE_COMPRESSION=1
```

- To set it back to the default CQE Zipping mode

```
mlxconfig -d mlx5_0 s CQE_COMPRESSION=0
```

- x86_64

Use command line parameter *txq_inline* and *txqs_min_inline* to get maximum performance:

- Messages sizes <=128B: *txq_inline*=128, *txqs_min_inline*=4
- Message sizes > 128: *txq_inline*=64, *txqs_min_inline*=4
- ConnectX-4 LX: *txq_inline*=200, *txqs_min_inline*=4
- ConnectX-5: use default values

Example:

```
./testpmd -c 0x1ff -n 4 -w
0000:08:00.0,txq_inline=128,txqs_min_inline=4 -w
0000:08:00.1,txq_inline=128,txqs_min_inline=4 --socket-mem=2048,0 --
--port-numa-config=0,0,1,0 --socket-num=0 --burst=64 --txd=1024 --
rxd=256 --mbcache=512 --rxq=4 --txq=4 --nb-cores=8 -i
```

3.2 KVM Settings

1. Make sure that Hypervisor kernel is 3.16 or newer (For example Ubuntu 14.10 or Fedora 20/21 can be used).
2. Configure boot with "iommu=pt".
3. Use 1G huge pages.
4. Make sure to allocate a VM on huge pages

Example:

qemu is started with the following commands:

```
umount /mnt/huge 2> /dev/null
mount -t hugetlbfs none /mnt/huge &&
echo 8192 > /sys/kernel/mm/hugepages/hugepages-2048kB/nr_hugepages &&

numactl --cpunodebind 1 --membind 1 -- \
qemu-system-x86_64 \
-smp 24 \
-m 4G \
-mem-path /mnt/huge \
-mem-prealloc \
-enable-kvm \
-cpu host \
-serial tcp::999,server,nowait \
-nographic \
-vga none \
- -device pci-assign,host=83:00.1 \
-device pci-assign,host=84:00.1 \
-drive snapshot=on,file=/opt/vm/ubuntu-14.04-template.qcow2 \
-drive file=/data/data.img
```

Since both adapters are installed on NUMA node 1 PCI slots (CPU socket 1), *numactl is used to bind qemu to CPU threads and memory from that node only, which makes a Virtual Machine without NUMA internally.

All its memory is allocated from huge pages in /mnt/huge.

- After loading VM, verify huge pages on your Hypervisor is used by VM:

```
cat /sys/devices/system/node/node<NUM>/hugepages/hugepages-<PAGE-  
SIZE>/free_hugepages
```

- Make sure to set CPU pining

For example if you run qemu:

```
(qemu) info cpus  
CPU #0: pc=0xffffffff81056306 (halted) thread_id=2719  
CPU #1: pc=0xffffffff81056306 (halted) thread_id=2720  
CPU #2: pc=0xffffffff81056306 (halted) thread_id=2723  
CPU #3: pc=0xffffffff81056306 (halted) thread_id=2724  
taskset -p 0x1 2719  
taskset -p 0x2 2720  
taskset -p 0x4 2723  
taskset -p 0x8 2724
```

- It is recommended to use small TX and RX queues, the number of descriptors should be <= 512

4 Running DPDK Application with Mellanox Poll-Mode Driver

Mellanox NICs must not be unbound from the kernel. Although the control path is not through uio/vfio, it still uses the existing kernel drivers while the data path bypasses kernel.

4.1 ConnectX®-3 Pro

For example:

```
./testpmd -c 0xe000 -n 4 --socket-mem=0,2048 -- --port-numa-config=0,1,1,1
--socket-num=1 --burst=64 --txd=256 --rxd=256 --mbcache=512 --rxq=1 --
txq=1 --nb-cores=2 --i
```

Specific PCI address can be used to specify the NIC:

```
./testpmd -c 0xe000 -n 4 -w 0000:08:00.0 --socket-mem=0,2048 -- --port-numa-
config=0,1,1,1 --socket-num=1 --burst=64 --txd=256 --rxd=256 --mbcache=512
--rxq=1 --txq=1 --nb-cores=2 --i
```

NOTE: In ConnectX-3 NICs, a single PCI address represents 2 ports.

When running bi-directional traffic, for better performance, use the receive-inline feature that can be enabled by the env variable `MLX4_INLINE_RECV_SIZE`.

Example: for 64B messages

```
MLX4_INLINE_RECV_SIZE=64 ./testpmd -c 0xe000 -n 4 --socket-mem=0,2048 -- --
port-numa-config=0,1,1,1 --socket-num=1 --burst=64 --txd=256 --rxd=256 --
mbcache=512 --rxq=1 --txq=1 --nb-cores=2 --i
```

4.2 ConnectX®-4 / ConnectX®-4 Lx / ConnectX®-5

For example:

Specific PCI address can be used to specify NIC's ports:

```
./testpmd -c 0x1fff -n 4 -w 0000:08:00.0
-w 0000:08:00.1 --socket-mem=2048,0 -- --port-numa-config=0,0,1,0 --socket-
num=0 --burst=64 --txd=1024 --rxd=256 --mbcache=512 --rxq=4 --txq=4 --nb-
cores=8 --i
```

NOTE: In ConnectX-4 NICs, a PCI address represents each port.

For best performance with ConnectX-4 NIC:

```
./testpmd -c 0x1fff -n 4 -w 0000:08:00.0,txq_inline=128
-w 0000:08:00.1,txq_inline=128 --socket-mem=2048,0 -- --port-numa-
config=0,0,1,0 --socket-num=0 --burst=64 --txd=1024 --rxd=256 --mbcache=512
--rxq=4 --txq=4 --nb-cores=8 --rss-udp --i
```

NOTE: ConnectX-4: It is recommended to use **txq_inline=128** parameter for best performance for 64B and 128B messages with more multiple cores to achieve max performance.

NOTE: ConnectX-4: It is recommended to use **txq_inline=64** parameter for best performance for messages $\geq 256B$ with multiple cores to achieve max performance.

NOTE: `--rss-udp testpmd` option should be used to achieve best spreading of UDP flows.

Some ConnectX-4 Lx cards are single port cards. To run testpmd fwd test on one port:

```
./testpmd -c 0xe000 -n 4 -w 0000:08:00.0,txq_inline=200 --socket-  
mem=2048,0 -- --port-numa-config=0,0,1,0 --socket-num=0 --burst=64 --  
txd=4096 --rxd=1024 --mbcache=512 --rxq=4 --txq=4 --nb-cores=4 --rss-udp --i
```

NOTE: ConnectX-4 LX: It is recommended to use **txq_inline=200** parameter for best performance for 64B messages with multiple cores to achieve maximum performance

NOTE: `--rss-udp testpmd` option should be used to achieve best spreading of UDP flows.

For ConnectX-5 cards, default values will bring the best performance:

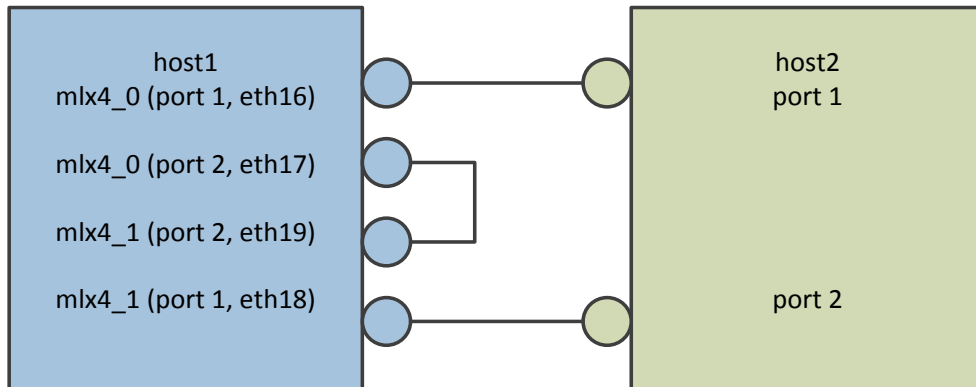

```
./testpmd -c 0xff00ff00 -n 4 -w 84:00.0 --socket-mem=0,8192 -- --port-numa-  
config=0,1 --socket-num=1 --burst=128 --txd=512 --rxd=512 --mbcache=512 -  
rxq=15 --txq=15 --nb-cores=15 -i --rss-udp -a
```

5 Sanity Check

Provided that all software components have been successfully installed and at least one ConnectX® adapter is present in the host system, run `testpmd` to test PMD.

These examples assume that there is a host with two dual port adapters that that:

- First port of each NIC is linked to another similar host
- Second port of each NIC is linked with each other

Run `*testpmd*` interactively from the DPDK build tree (for more information about its command-line options, please refer to its documentation:

http://www.dpdk.org/doc/guides/testpmd_app_ug/index.html):

```

root# ~/DPDK/x86_64-native-linuxapp-gcc/app/test-pmd/testpmd -c
0xf000f000 -n 4 -d -- -i

  filter on
  qinq(extend) off

***** Infos for port 3 *****
MAC address: 00:02:C9:B5:BA:B1
Connect to socket: 0
memory allocation on the socket: 0
Link status: up
Link speed: 40000 Mbps
Link duplex: full-duplex
Promiscuous mode: enabled
Allmulticast mode: disabled
Maximum number of MAC addresses: 128
Maximum number of MAC addresses of hash filtering: 0
VLAN offload:
  strip on
  filter on
  qinq(extend) off
testpmd>

```

5. Start IO forwarding between ports 1 and 3. The `*tx_first*` argument tells
6. `*testpmd*` to send a single packet burst which will be always forwarded by both ports:

```

testpmd> set fwd io
Set io packet forwarding mode
testpmd> set portlist 1,3
previous number of forwarding ports 4 - changed to number of
configured ports 2
testpmd> start tx_first
io packet forwarding - CRC stripping disabled - packets/burst=32
nb forwarding cores=1 - nb forwarding ports=2
RX queues=1 - RX desc=128 - RX free threshold=0
RX threshold registers: pthresh=8 hthresh=8 wthresh=0
TX queues=1 - TX desc=512 - TX free threshold=0
TX threshold registers: pthresh=32 hthresh=0 wthresh=0
TX RS bit threshold=0 - TXQ flags=0x0
testpmd>

```

7. Display `*testpmd*` port statistics:

```

testpmd> show port stats all

##### NIC statistics for port 0 #####
RX-packets: 0          RX-missed: 0          RX-bytes: 0
RX-badcrc: 0          RX-badlen: 0          RX-errors: 0
RX-nobuf: 0
TX-packets: 0          TX-errors: 0          TX-bytes: 0
#####

##### NIC statistics for port 1 #####
RX-packets: 60800584   RX-missed: 0          RX-bytes: 3891239534
RX-badcrc: 0          RX-badlen: 0          RX-errors: 0
RX-nobuf: 0
TX-packets: 61146609   TX-errors: 0          TX-bytes: 3913382976

```

```
#####
##### NIC statistics for port 2 #####
RX-packets: 0          RX-missed: 0          RX-bytes: 0
RX-badcrc: 0          RX-badlen: 0          RX-errors: 0
RX-nombuf: 0
TX-packets: 0          TX-errors: 0          TX-bytes: 0
#####
##### NIC statistics for port 3 #####
RX-packets: 61146920  RX-missed: 0          RX-bytes: 3913402990
RX-badcrc: 0          RX-badlen: 0          RX-errors: 0
RX-nombuf: 0
TX-packets: 60800953  TX-errors: 0          TX-bytes: 3891262080
#####
testpmd>
```

8. Stop forwarding:

```
testpmd> stop
Telling cores to stop...
Waiting for lcores to finish...

----- Forward statistics for port 1 -----
RX-packets: 78238689    RX-dropped: 0          RX-total: 78238689
TX-packets: 78681769    TX-dropped: 0          TX-total: 78681769
-----

----- Forward statistics for port 3 -----
RX-packets: 78681737    RX-dropped: 0          RX-total: 78681737
TX-packets: 78238721    TX-dropped: 0          TX-total: 78238721
-----

+++++++ Accumulated forward statistics for all ports+++++++
RX-packets: 156920426    RX-dropped: 0          RX-total: 156920426
TX-packets: 156920490    TX-dropped: 0          TX-total: 156920490
+++++++

Done.
testpmd>
```

9. Exit testpmd.

```
testpmd> quit
Stopping port 0...done
Stopping port 1...done
Stopping port 2...done
Stopping port 3...done
bye...
root#
```
