1 Overview

This is the Quick Start Guide for mlx4 and mlx5 DPDK Poll-Mode Driver (PMD) for Mellanox ConnectX®-3/ConnectX®-3 Pro and ConnectX®-4/ConnectX®-4 Lx Ethernet adapters.

2 MLNX_DPDK Installation and Configuration

2.1 Installing ConnectX-3 and ConnectX-3 Pro

2.1.1 Bare Metal

1. Install MLNX_OFED v3.2-x.x.x.

MLNX_OFED 3.2-x.x.x can be downloaded from Mellanox site:

http://www.mellanox.com/page/products_dyn?product_family=26&mtag=linux

2. Verify that ConnectX-3/ConnectX-3 Pro firmware is **2.36.5000** (Use `ibstat` command).
3. Set all the ports to Ethernet.

```
connectx_port_config
```

and follow the instructions on the screen.

For further instructions on how to run the script, please refer to the MLNX_OFED User Manual.

4. Add the following line to `/etc/modprobe.d/mlx4_core.conf`.

```
options mlx4_core log_num_mgm_entry_size=-7
```

NOTE: If VLAN filtering is used, set `log_num_mgm_entry_size=-1`.

NOTE: Please be aware, performance penalty can occur in this case.

5. Restart MLNX_OFED.

```
/etc/init.d/openib restart
```

6. Extract the package `MLNX_DPDK-2.2_1.6.tar.gz`

The default mlx4 configuration in `config/common_linuxapp` is the following:

```
#  
# Compile burst-oriented Mellanox ConnectX-3 (MLX4) PMD  
#  
CONFIG_RTE_LIBRTE_MLX4_PMD=y
```

```
CONFIG_RTE_LIBRTE_MLX4_DEBUG=n
CONFIG_RTE_LIBRTE_MLX4_SGE_WR_N=1
CONFIG_RTE_LIBRTE_MLX4_MAX_INLINE=0
CONFIG_RTE_LIBRTE_MLX4_TX_MP_CACHE=8
CONFIG_RTE_LIBRTE_MLX4_SOFT_COUNTERS=1
```

7. Compile DPDK.

```
make install T=x86_64-native-linuxapp-gcc
```

For more advanced DPDK compilation options, please refer to dpdk.org documentation:

http://www.dpdk.org/doc/guides/linux_gsg/index.html

8. Configure huge pages according to the NUMA the card is connected to

```
echo $PAGE_NUM >
/sys/devices/system/node/node$NUMA_NODE/hugepages/hugepages-
"$PAGE_SIZE"kB/nr_hugepages

mkdir -p /mnt/huge

HTLB_MOUNTED=$( mount | grep "type hugetlbfs" | wc -l)
if [ $HTLB_MOUNTED -eq 0 ]; then
    mount -t hugetlbfs hugetlb /mnt/huge
fi
```

2.1.2 KVM

2.1.2.1 KVM Hypervisor

1. Download MLNX_OFED 3.2-x.x.x.

MLNX_OFED 3.2-x.x.x can be downloaded from Mellanox site:

http://www.mellanox.com/page/products_dyn?product_family=26&mtag=linux

2. Install MLNX_OFED v3.2-x.x.x and enable SR-IOV.

```
./mlnxofedinstall --enable-sriov -hypervisor
```

Please follow MLNX_OFED User Manual instructions how to enable SR-IOV.

3. Verify that ConnectX-3/ConnectX-3 Pro firmware is **2.36.5000** (Use `ibstat` command).

4. Add the following line to `/etc/modprobe.d/mlx4_core.conf`.

```
options mlx4_core log_num_mgm_entry_size=-7
```

NOTE: If VLAN filtering is used, set `log_num_mgm_entry_size=-1`.

Please be aware, performance penalty can occur in this case.

5. Restart MLNX_OFED.

```
/etc/init.d/openibd restart
```

2.1.2.2 KVM Virtual Machine

1. Download MLNX_OFED 3.2-x.x.x.

MLNX_OFED 3.2-x.x.x can be downloaded from Mellanox site:

http://www.mellanox.com/page/products_dyn?product_family=26&mtag=linux

2. Install MLNX_OFED v3.2-x.x.x and enable the guest.

```
./mlnxofedinstall --guest
```

3. Extract the package MLNX_DPDK-2.2_1.6.tar.gz
4. The default mlx4 configuration in config/common_linuxapp is the following:

```
#
# Compile burst-oriented Mellanox ConnectX-3 (MLX4) PMD
#
CONFIG_RTE_LIBRTE_MLX4_PMD=y
CONFIG_RTE_LIBRTE_MLX4_DEBUG=n
CONFIG_RTE_LIBRTE_MLX4_SGE_WR_N=1
CONFIG_RTE_LIBRTE_MLX4_MAX_INLINE=0
CONFIG_RTE_LIBRTE_MLX4_TX_MP_CACHE=8
CONFIG_RTE_LIBRTE_MLX4_SOFT_COUNTERS=1
```

5. Compile DPDK.

```
make install T=x86_64-native-linuxapp-gcc
```

For more advanced DPDK compilation options, please refer to dpdk.org documentation:

http://www.dpdk.org/doc/guides/linux_gsg/index.html

6. Configure huge pages

```
echo $PAGE_NUM > /sys/devices/system/node/node0/hugepages/hugepages-
"$PAGE_SIZE"kB/nr_hugepages
```

```
mkdir -p /mnt/huge
```

```
HTLB_MOUNTED=$( mount | grep "type hugetlbfs" | wc -l)
if [ $HTLB_MOUNTED -eq 0 ]; then
    mount -t hugetlbfs hugetlb /mnt/huge
fi
```

2.1.3 ESX6.0 UP1

2.1.3.1 ESX: VMWare

1. Download MLNX-OFED-ESX-2.4.0.0

MLNX-OFED-ESX-2.4.0.0 can be downloaded from Mellanox site:

http://www.mellanox.com/page/products_dyn?product_family=29

2. Install MLNX-OFED-ESX-2.4.0.0.

```
esxcli software vib install -d /FULL_PATH/MLNX-OFED-ESX-2.4.0.0-10EM-
600.0.0.2494585.zip
```

3. Update the firmware on ESX.

FW can be downloaded from Mellanox site :

http://www.mellanox.com/page/vmware_matrix_hcl?mtag=vmware_driver

```
/opt/mellanox/bin/flint -d /dev/mt4099_pciconf0 -i fw-ConnectX3-rel-
2_36_5000-MCX354A-FCB_A2-A5-FlexBoot-3.4.718.bin b
```

4. Verify that ConnectX-3/ConnectX-3 Pro firmware is **2.36.5000**.

```
/opt/mellanox/bin/flint -d /dev/mt4099_pciconf0 q
```

5. Enable SR-IOV on VMWare.

```
esxcli system module parameters set -m mlx4_core -p "num_vfs=4,4,0
log_num_mgm_entry_size=-1"
```

6. Restart MLNX_OFED.

```
/opt/mellanox/bin/openibd restart
```

2.1.3.2 ESX: VM Virtual Machine

1. Install MLNX_OFED v3.1-x.x.x.

MLNX_OFED 3.1-x.x.x can be downloaded from Mellanox site:

http://www.mellanox.com/page/products_dyn?product_family=26&mtag=linux

```
./mlnxofedinstall --guest
```

2. Extract the MLNX_DPDK-2.2_1.6.tar.gz package.

The default mlx4 configuration in config/common_linuxapp

is the following:

```
#
# Compile burst-oriented Mellanox ConnectX-3 (MLX4) PMD
#
CONFIG_RTE_LIBRTE_MLX4_PMD=y
CONFIG_RTE_LIBRTE_MLX4_DEBUG=n
CONFIG_RTE_LIBRTE_MLX4_SGE_WR_N=1
CONFIG_RTE_LIBRTE_MLX4_MAX_INLINE=0
CONFIG_RTE_LIBRTE_MLX4_TX_MP_CACHE=8
CONFIG_RTE_LIBRTE_MLX4_SOFT_COUNTERS=1
```

3. Compile DPDK.

```
make install T=x86_64-native-linuxapp-gcc
```

For more advanced DPDK compilation options, please refer to dpdk.org documentation:

http://www.dpdk.org/doc/guides/linux_gsg/index.html

4. Configure huge pages.

```
echo $PAGE_NUM > /sys/devices/system/node/node0/hugepages/hugepages-
"$PAGE_SIZE"kB/nr_hugepages

mkdir -p /mnt/huge

HTLB_MOUNTED=$( mount | grep "type hugetlbfs" | wc -l)
if [ $HTLB_MOUNTED -eq 0 ]; then
    mount -t hugetlbfs hugetlb /mnt/huge
fi
```

2.2 Installing ConnectX-4 and ConnectX-4 LX

2.2.1 Bare Metal

1. Download MLNX_OFED 3.2-2.x.x.

MLNX_OFED 3.2-2.x.x can be downloaded from Mellanox site:

http://www.mellanox.com/page/products_dyn?product_family=26&mtag=linux

2. Install MLNX_OFED v3.2-2.x.x.
3. Verify that ConnectX-4 firmware is **12.14.2036** and ConnectX-4 Lx firmware is **14.14.2036**.
4. Set all the ports to Ethernet.

```
mst start

mlxconfig -d <device> set LINK_TYPE_P1/2=1/2/3
* LINK_TYPE_P1=<1|2|3> , 1=Infiniband 2=Ethernet 3=VPI(auto-sense)
```

```
For example:
mlxconfig -d /dev/mst/mt4115_pciconf0 set LINK_TYPE_P1=2

mlxfwreset -d <device> reset
```

For further instructions on how to run the script, please refer to the MLNX_OFED User Manual.

5. Restart MLNX_OFED.

```
/etc/init.d/openib restart
```

6. Extract the package MLNX_DPDK-2.2_1.6.tar.gz

7. The default mlx5 configuration in config/common_linuxapp is the following:

```
#
# Compile burst-oriented Mellanox ConnectX-4 (MLX5) PMD
#
CONFIG_RTE_LIBRTE_MLX5_PMD=y
CONFIG_RTE_LIBRTE_MLX5_DEBUG=n
CONFIG_RTE_LIBRTE_MLX5_SGE_WR_N=1
CONFIG_RTE_LIBRTE_MLX5_MAX_INLINE=0
CONFIG_RTE_LIBRTE_MLX5_TX_MP_CACHE=8
CONFIG_RTE_LIBRTE_MLX5_VERBS_VLAN_INSERTION=n
```

8. Compile DPDK.

```
make install T=x86_64-native-linuxapp-gcc
```

For more advanced DPDK compilation options, please refer to dpdk.org documentation:

http://www.dpdk.org/doc/guides/linux_gsg/index.html

9. Configure huge pages according to the NUMA the card is connected to

```
echo $PAGE_NUM >
/sys/devices/system/node/node$NUMA_NODE/hugepages/hugepages-
"$PAGE_SIZE"kB/nr_hugepages

mkdir -p /mnt/huge

HTLB_MOUNTED=$( mount | grep "type hugetlbfs" | wc -l)
if [ $HTLB_MOUNTED -eq 0 ]; then
    mount -t hugetlbfs hugetlb /mnt/huge
fi
```

2.2.2 KVM

2.2.2.1 KVM Hypervisor

1. Download MLNX_OFED 3.2-2.x.x.

MLNX_OFED 3.2-2.x.x can be downloaded from Mellanox site:

http://www.mellanox.com/page/products_dyn?product_family=26&mtag=linux

2. Install MLNX_OFED v3.2-2.x.x.

3. Restart MLNX_OFED.

```
/etc/init.d/openib restart
```

4. Verify that ConnectX-4 firmware is **12.14.2036** and ConnectX-4 Lx firmware is **14.14.2036**.

5. Check if SR-IOV is enabled in the firmware

```
mlxconfig -d /dev/mst/mt4113_pciconf0 q
Device #1: -----
```

```
Device type: Connect4
PCI device: /dev/mst/mt4115_pciconf0
Configurations: Current
SRIOV_EN 1
NUM_OF_VFS 8
```

6. If needed, use `mlxconfig` to set the relevant fields:

```
mlxconfig -d /dev/mst/mt4113_pciconf0 set SRIOV_EN=1 NUM_OF_VFS=16
mlxfwreset -d <device> reset
```

7. Set all the ports to Ethernet.

```
mst start

mlxconfig -d <device> set LINK_TYPE_P1/2=1/2/3
* LINK_TYPE_P1=<1|2|3> , 1=Infiniband 2=Ethernet 3=VPI (auto-sense)
For example:
mlxconfig -d /dev/mst/mt4115_pciconf0 set LINK_TYPE_P1=2

mlxfwreset -d <device> reset
```

For further instructions on how to run the script, please refer to the `MLNX_OFED User Manual`.

8. Write to the `sysfs` file the number of Virtual Functions you need to create for the PF.

A standard Linux kernel generated file that is available in the new kernels.

```
echo [num_vfs] > /sys/class/infiniband/mlx5_0/device/sriov_numvfs
```

For further information, please refer to the `MLNX_OFED User Manual` section "Configuring SR-IOV for ConnectX-4/Connect-IB".

2.2.2.2 KVM Virtual Machine

1. Download `MLNX_OFED 3.2-2.x.x`.

`MLNX_OFED 3.2-2.x.x` can be downloaded from Mellanox site:

http://www.mellanox.com/page/products_dyn?product_family=26&mtag=linux

2. Install `MLNX_OFED v3.2-2.x.x` and enable the guest.

```
./mlnxofedinstall --guest
```

3. Extract the package `MLNX_DPDK-2.2_1.6.tar.gz`

4. The default `mlx5` configuration in `config/common_linuxapp` is the following:

```
#
# Compile burst-oriented Mellanox ConnectX-4 (MLX5) PMD
#
CONFIG_RTE_LIBRTE_MLX5_PMD=y
CONFIG_RTE_LIBRTE_MLX5_DEBUG=n
CONFIG_RTE_LIBRTE_MLX5_SGE_WR N=1
CONFIG_RTE_LIBRTE_MLX5_MAX_INLINE=0
CONFIG_RTE_LIBRTE_MLX5_TX_MP_CACHE=8
CONFIG_RTE_LIBRTE_MLX5_VERBS_VLAN_INSERTION=n
```

5. Compile DPDK.

```
make install T=x86_64-native-linuxapp-gcc
```

For more advanced DPDK compilation options, please refer to `dpgk.org` documentation:

http://www.dpdk.org/doc/guides/linux_gsg/index.html

6. Configure huge pages.

```
echo $PAGE_NUM > /sys/devices/system/node/node0/hugepages/hugepages-
"$PAGE_SIZE"kB/nr_hugepages

mkdir -p /mnt/huge

HTLB_MOUNTED=$( mount | grep "type hugetlbfs" | wc -l)
if [ $HTLB_MOUNTED -eq 0 ]; then
    mount -t hugetlbfs hugetlb /mnt/huge
fi
```

2.3 Configuring PMD Debug Mode

➤ To enable Debug mode:

1. Modify the `config/common_linuxapp` file.
 - For ConnectX-3 PMD: `CONFIG_RTE_LIBRTE_MLX4_DEBUG=y`
 - For ConnectX-4 PMD: `CONFIG_RTE_LIBRTE_MLX5_DEBUG=y`
2. Compile DPDK.

```
rm -rf x86_64-native-linuxapp-gcc
make install T=x86_64-native-linuxapp-gcc
```

2.4 Sending and Receiving Jumbo Frames

If the `mbuf` size is smaller than the MTU size and you need to use scattered `mbuf`.

1. Modify the `config/common_linuxapp` file.
 - For ConnectX-3 PMD: `CONFIG_RTE_LIBRTE_MLX4_SGE_WR_N=4`
 - For ConnectX-4 PMD: `CONFIG_RTE_LIBRTE_MLX5_SGE_WR_N=4`
2. Compile DPDK.

```
rm -rf x86_64-native-linuxapp-gcc
make install T=x86_64-native-linuxapp-gcc
```

3. Set the appropriate MTU using the `rte_eth_dev_set_mtu` API.

2.5 Setting RX VLAN Filter on ConnectX-3

1. Make sure that regular steering mode is configured.

```
cat /sys/module/mlx4_core/parameters/log_num_mgm_entry_size -1
```
2. Modify the `/etc/modprobe.d/mlnx.conf` file if required and restart `MLNX_OFED`.
3. Configure VLAN interface on the port using standard Linux tools.
4. Add or remove VLAN using the `rte_eth_dev_vlan_filter()` DPDK API.

2.6 TX VLAN Insertion Configuration on ConnectX-4/ConnectX-4 Lx

PMD, by default, uses the software's logic to insert the VLAN header.

NOTE: For ConnectX-4 adapters please configure HW TX VLAN insertion to achieve best performance.

The default setting in config/common_linuxapp is

```
CONFIG_RTE_LIBRTE_MLX5_VERBS_VLAN_INSERTION =n.
```

To use HW TX VLAN insertion on ConnectX-4, configure:

```
CONFIG_RTE_LIBRTE_MLX5_VERBS_VLAN_INSERTION =y.
```

NOTE: Supported only with MLNX_OFED > 3.2-1.5.0.1.

2.7 Enable HW Packet Padding

Environment variable `MLX5_PMD_ENABLE_PADDING` enables the HW end packet padding in the PCI bus transactions.

In cases the PCI bandwidth is the bottleneck, padding can improve performance by 10%.

This is disabled by default since this can also decrease performance for unaligned packet sizes.

3 System Performance Configuration

3.1 General Settings

- Use the CPU near local NUMA node to which the PCIe adapter is connected, for better performance.

For Virtual Machines (VM), verify that the right CPU and NUMA node are pinned for the VM according to the above. If possible, connect you NIC near NUMA node 0. Run `mst status -v` to identify the NUMA node to which the PCIe adapter is connected

```
mst status -v
MST modules:
-----
MST PCI module loaded
MST PCI configuration module loaded
PCI devices:
-----
DEVICE_TYPE          MST          PCI          RDMA
NET
ConnectX3Pro (rev:0) /dev/mst/mt4103_pciconf0
ConnectX3Pro (rev:0) /dev/mst/mt4103_pci_cr0    04:00.0    mlx4_0
net-eth4,net-eth5
```

- If more than one adapter is used, verify that both adapters are located on the same PCI bus (as each CPU socket on a Crown Pass platform manages its own PCI bus) in order to forward packets from one to the other without NUMA performance penalty.
- **ConnectX-3:**

- Verify the optimized steering mode is configured

```
cat /sys/module/mlx4_core/parameters/log_num_mgm_entry_size -7
```

- If not, modify `/etc/modprobe.d/mlx4_core.conf` and restart `MLNX_OFED`

- **ConnectX-4:**

When the number of RX queues is larger than 2, for best 64B message performance, please compile `mlx5 PMD` with the following parameter (modify `config/common_linuxapp`)

- On ConnectX-4 Lx:

```
CONFIG_RTE_LIBRTE_MLX5_MAX_INLINE=200
```

- On ConnectX-4:

```
CONFIG_RTE_LIBRTE_MLX5_MAX_INLINE=64
```

Make sure to set environment variable `MLX5_ENABLE_CQE_COMPRESSION=1`

```
MLX5_ENABLE_CQE_COMPRESSION=1 ./testpmd -c 0x1ff -n 4 --socket-
mem=2048,0 -- --port-numa-config=0,0,1,0 --socket-num=0 --burst=64 --
txd=4096 --rxd=1024 --mbcache=512 --rxq=4 --txq=4 --nb-cores=8 --i
```

- **Check the Core Frequency**

Check that the output CPU frequency for each core is equal to the maximum supported and that all core frequencies are consistent.

- Check the maximum supported CPU frequency:

```
#cat /sys/devices/system/cpu/cpu*/cpufreq/cpuinfo_max_freq
```

- Check that the core frequencies are consistent

```
#cat /proc/cpuinfo | grep "cpu MHz"
```

- Check that the output frequencies are the same as the maximum supported
- Check the current CPU frequency to check whether it is configured to max available frequency:

```
#cat /sys/devices/system/cpu/cpu*/cpufreq/cpuinfo_cur_freq
```

When the following CPU frequency modules are loaded, CPU scaling is enabled, and you can improve performance by setting the scaling mode to performance:

- **Set the scaling mode to performance for every CPU**

```
# echo performance >
/sys/devices/system/cpu/cpu<cpunumber>/cpufreq/scaling_governor
```

For further information, please refer to Performance Tuning Guide for Mellanox Adapters

(http://www.mellanox.com/related-docs/prod_software/Performance_Tuning_Guide_for_Mellanox_Network_Adapters.pdf)

- **Verify that Max_Read_Req BIOS parameter is set to 4K**

To obtain the current setting for the Max_Read_Req BIOS parameter:

```
setpci -s <NIC BIOS address> 68.w
```

example:

```
setpci -s 21:00.0 68.w
5026
```

If the output is different than 5XXX, set it by:

```
setpci -s <NIC BIOS address> 68.w=5XXX
```

NOTE: The XXX can be different on different systems. Make sure to configure according to the setpci output..

For example:

```
setpci -s 84:00.0 68.w
2026
Run: setpci -s 84:00.0 68.w=5026
```

- **Disable pause frames on all network interfaces managed by mlx4_en/mlx5_en**

```
lldpad stop
```

```
ethtool -A eth16 rx off tx off
```

NOTE: In certain systems, pause frames are used to increase performance.

- **Use 1Gb huge pages**
- **Hyper threading**

In certain DPDK application, enabling hyper threading results in better performance. For benchmarking purposes, it is recommended to disable hyper threading

- **Make sure that unnecessary System Management Interrupts (SMIs) are disabled**
SMI that are used for Power Monitoring and for Memory PreFailure Notification are recommended to be disabled. Please refer to your server provider guides for recommended platform tuning.

- **Isolate used cores**

Use `isolcpus` command for boot configuration.

For example, add the following to kernel boot parameters:

```
isolcpus=2,3
```

- **Disable kernel memory compaction**

```
echo never > /sys/kernel/mm/transparent_hugepage/defrag
echo never > /sys/kernel/mm/transparent_hugepage/enabled
echo 0 > /sys/kernel/mm/transparent_hugepage/khugepaged/defrag
sysctl -w vm.swappiness=0
sysctl -w vm.zone_reclaim_mode=0
```

- **Interrupts configuration**

NOTE: Interrupts configuration should be performed only if the needed performance was not achieved.

- Stop irqbalancer

```
service irqbalance stop
```

- Set all possible interrupts to different NUMA:

```
Example: echo '6-9' | sudo tee /proc/irq/*/smp_affinity_list
```

- Set NIC interrupts to same NUMA:

Example:

```
set_irq_affinity_cpulist.sh 0-1 ethX
```

- Set other NIC interrupts to different NUMA:

Example:

```
set_irq_affinity_cpulist.sh 6-9 ethY
```

3.2 KVM Settings

1. Make sure that Hypervisor kernel is 3.16 or newer (For example Ubuntu 14.10 or Fedora 20/21 can be used).
2. Configure boot with `"iommu=pt"`.
3. Use 1G huge pages.
4. Make sure to allocate a VM on huge pages

Example:

qemu is started with the following commands:

```
umount /mnt/huge 2> /dev/null
```

```

mount -t hugetlbfs none /mnt/huge &&
echo 8192 > /sys/kernel/mm/hugepages/hugepages-2048kB/nr_hugepages &&

numactl --cpunodebind 1 --membind 1 -- \
qemu-system-x86_64 \
-smp 24 \
-m 4G \
-mem-path /mnt/huge \
-mem-prealloc \
-enable-kvm \
-cpu host \
-serial tcp::999,server,nowait \
-nographic \
-vga none \
- -device pci-assign,host=83:00.1 \
-device pci-assign,host=84:00.1 \
-drive snapshot=on,file=/opt/vm/ubuntu-14.04-template.qcow2 \
-drive file=/data/data.img

```

Since both adapters are installed on NUMA node 1 PCI slots (CPU socket 1), `*numactl` is used to bind `qemu` to CPU threads and memory from that node only, which makes a Virtual Machine without NUMA internally.

All its memory is allocated from huge pages in `/mnt/huge`.

- After loading VM, verify huge pages on your Hypervisor is used by VM:

```

cat /sys/devices/system/node/node<NUM>/hugepages/hugepages-<PAGE-
SIZE>/free_hugepages

```

- Make sure to set CPU pining

For example if you run `qemu`:

```

(qemu) info cpus
CPU #0: pc=0xffffffff81056306 (halted) thread_id=2719
CPU #1: pc=0xffffffff81056306 (halted) thread_id=2720
CPU #2: pc=0xffffffff81056306 (halted) thread_id=2723
CPU #3: pc=0xffffffff81056306 (halted) thread_id=2724
taskset -p 0x1 2719
taskset -p 0x2 2720
taskset -p 0x4 2723
taskset -p 0x8 2724

```

3.3 PowerKVM Setting

- Use PowerKVM 3.1 and above
- Make sure to configure 1G huge pages
- Make sure to use isolated CPUs (using `grub2`):

```

in /etc/default/grub configure
rd.lvm.lv=ibmpkvm_vg_root00/ibmpkvm_lv_data isolcpus=0-39

```

This will isolate Cores 0 - 39

```

grub2-mkconfig -o /boot/grub2/grub.cfg

```

Verify it was configured with `cat /proc/cmdline`

4 Running DPDK Application with Mellanox Poll-Mode Driver

4.1 ConnectX®-3 / ConnectX®-3 Pro

Since mlx4 PMD is compiled statically with MLNX_DPDK 2.1, no special requirements are needed to run the application with mlx4 PMD.

For example:

```
./testpmd -c 0xe000 -n 4 --socket-mem=0,2048 -- --port-numa-config=0,1,1,1
--socket-num=1 --burst=64 --txd=256 --rxq=256 --mbcache=512 --rxq=1 --
txq=1 --nb-cores=2 --i
```

Specific PCI address can be used to specify the NIC:

```
./testpmd -c 0xe000 -n 4 -w 0000:08:00.0 --socket-mem=0,2048 -- --port-numa-
config=0,1,1,1 --socket-num=1 --burst=64 --txd=256 --rxq=256 --mbcache=512
--rxq=1 --txq=1 --nb-cores=2 --i
```

NOTE: In ConnectX-3 NICs, a single PCI address represents 2 ports.

When running bi-directional traffic, for better performance, use the receive-inline feature that can be enabled by the env variable MLX4_INLINE_RECV_SIZE.

Example: for 64B messages

```
MLX4_INLINE_RECV_SIZE=64 ./testpmd -c 0xe000 -n 4 --socket-mem=0,2048 -- --
port-numa-config=0,1,1,1 --socket-num=1 --burst=64 --txd=256 --rxq=256 --
mbcache=512 --rxq=1 --txq=1 --nb-cores=2 --i
```

4.2 ConnectX®-4 / ConnectX®-4 Lx

Since mlx5 PMD is compiled statically with MLNX_DPDK 2.1, no special requirements are needed to run the application with mlx5 PMD.

For example:

```
MLX5_ENABLE_CQE_COMPRESSION=1 ./testpmd -c 0x1fff -n 4 --socket-mem=2048,0 --
--port-numa-config=0,0,1,0 --socket-num=0 --burst=64 --txd=4096 --rxq=1024 --
mbcache=512 --rxq=4 --txq=4 --nb-cores=8 --i
```

Specific PCI address can be used to specify NIC's ports:

```
MLX5_ENABLE_CQE_COMPRESSION=1 ./testpmd -c 0x1fff -n 4 -w 0000:08:00.0 -w
0000:08:00.1 --socket-mem=2048,0 -- --port-numa-config=0,0,1,0 --socket-
num=0 --burst=64 --txd=4096 --rxq=1024 --mbcache=512 --rxq=4 --txq=4 --nb-
cores=8 --i
```

NOTE: In ConnectX-4 NICs, a PCI address represents each port.

Some ConnectX-4 Lx cards are single port cards. To run testpmd fwd test on one port:

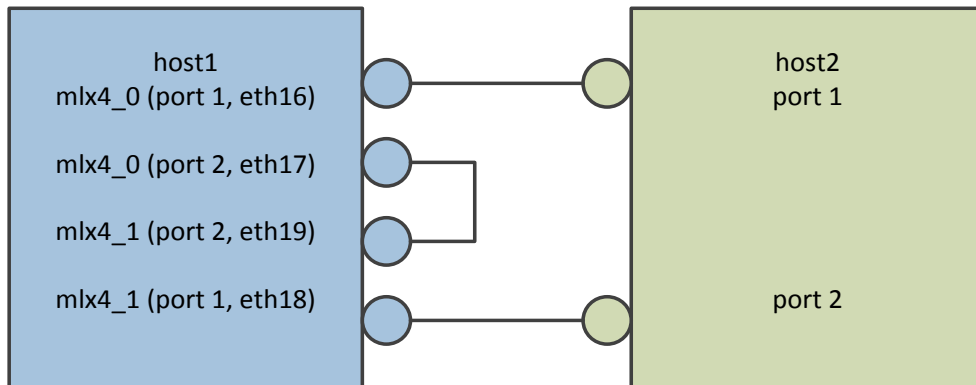

```
MLX5_ENABLE_CQE_COMPRESSION=1 ./testpmd -c 0xe000 -n 4 -w 0000:08:00.0 ----
socket-mem=2048,0 -- --port-numa-config=0,0,1,0 --socket-num=0 --burst=64 --
txd=4096 --rxq=1024 --mbcache=512 --rxq=4 --txq=4 --nb-cores=4 --i
```

5 Sanity Check

Provided that all software components have been successfully installed and at least one ConnectX® adapter is present in the host system, run testpmd to test PMD.

These examples assume that there is a host with two dual port adapters that that:

- First port of each NIC is linked to another similar host
- Second port of each NIC is linked with each other

1. Run `*testpmd*` interactively from the DPDK build tree (for more information about its command-line options, please refer to its documentation:

http://www.dpdk.org/doc/guides/testpmd_app Ug/index.html):

```
root# ~/DPDK/x86_64-native-linuxapp-gcc/app/test-pmd/testpmd -c

Port 3 Link Up - speed 40000 Mbps - full-duplex
Done
testpmd>

```

The following commands are typed from the *testpmd* interactive prompt.

1. Check port status:

```

testpmd> show port info all
***** Infos for port 0 *****
MAC address: 00:02:C9:B5:B7:50
Connect to socket: 0
memory allocation on the socket: 0
Link status: up
Link speed: 10000 Mbps
Link duplex: full-duplex
Promiscuous mode: enabled
Allmulticast mode: disabled
Maximum number of MAC addresses: 128
Maximum number of MAC addresses of hash filtering: 0
VLAN offload:
  strip on
  filter on
  qinq(extend) off

***** Infos for port 1 *****
MAC address: 00:02:C9:B5:B7:51
Connect to socket: 0
memory allocation on the socket: 0
Link status: up
Link speed: 40000 Mbps
Link duplex: full-duplex
Promiscuous mode: enabled
Allmulticast mode: disabled
Maximum number of MAC addresses: 128
Maximum number of MAC addresses of hash filtering: 0
VLAN offload:
  strip on
  filter on

```

```

qinq(extend) off

***** Infos for port 2 *****
MAC address: 00:02:C9:B5:BA:B0
Connect to socket: 0
memory allocation on the socket: 0
Link status: up
Link speed: 10000 Mbps
Link duplex: full-duplex
Promiscuous mode: enabled
Allmulticast mode: disabled
Maximum number of MAC addresses: 128
Maximum number of MAC addresses of hash filtering: 0
VLAN offload:
  strip on
  filter on
  qinq(extend) off

***** Infos for port 3 *****
MAC address: 00:02:C9:B5:BA:B1
Connect to socket: 0
memory allocation on the socket: 0
Link status: up
Link speed: 40000 Mbps
Link duplex: full-duplex
Promiscuous mode: enabled
Allmulticast mode: disabled
Maximum number of MAC addresses: 128
Maximum number of MAC addresses of hash filtering: 0
VLAN offload:
  strip on
  filter on
  qinq(extend) off
testpmd>

```

2. Start IO forwarding between ports 1 and 3. The `*tx_first*` argument tells
3. `*testpmd*` to send a single packet burst which will be always forwarded by both ports:

```

testpmd> set fwd io
Set io packet forwarding mode
testpmd> set portlist 1,3
previous number of forwarding ports 4 - changed to number of
configured ports 2
testpmd> start tx_first
io packet forwarding - CRC stripping disabled - packets/burst=32
nb forwarding cores=1 - nb forwarding ports=2
RX queues=1 - RX desc=128 - RX free threshold=0
RX threshold registers: pthresh=8 hthresh=8 wthresh=0
TX queues=1 - TX desc=512 - TX free threshold=0
TX threshold registers: pthresh=32 hthresh=0 wthresh=0
TX RS bit threshold=0 - TXQ flags=0x0
testpmd>

```

4. Display `*testpmd*` port statistics:

```

testpmd> show port stats all

##### NIC statistics for port 0 #####
RX-packets: 0          RX-missed: 0          RX-bytes: 0
RX-badcrc: 0          RX-badlen: 0          RX-errors: 0
RX-nobuf: 0
TX-packets: 0          TX-errors: 0          TX-bytes: 0
#####

##### NIC statistics for port 1 #####
RX-packets: 60800584   RX-missed: 0          RX-bytes: 3891239534
RX-badcrc: 0          RX-badlen: 0          RX-errors: 0
RX-nobuf: 0
TX-packets: 61146609   TX-errors: 0          TX-bytes: 3913382976

```

```
#####
##### NIC statistics for port 2 #####
RX-packets: 0          RX-missed: 0          RX-bytes: 0
RX-badcrc: 0          RX-badlen: 0          RX-errors: 0
RX-nombuf: 0
TX-packets: 0          TX-errors: 0          TX-bytes: 0
#####
##### NIC statistics for port 3 #####
RX-packets: 61146920  RX-missed: 0          RX-bytes: 3913402990
RX-badcrc: 0          RX-badlen: 0          RX-errors: 0
RX-nombuf: 0
TX-packets: 60800953  TX-errors: 0          TX-bytes: 3891262080
#####
testpmd>
```

5. Stop forwarding:

```
testpmd> stop
Telling cores to stop...
Waiting for lcores to finish...

----- Forward statistics for port 1 -----
RX-packets: 78238689    RX-dropped: 0          RX-total: 78238689
TX-packets: 78681769    TX-dropped: 0          TX-total: 78681769
-----

----- Forward statistics for port 3 -----
RX-packets: 78681737    RX-dropped: 0          RX-total: 78681737
TX-packets: 78238721    TX-dropped: 0          TX-total: 78238721
-----

+++++++ Accumulated forward statistics for all ports+++++++
RX-packets: 156920426    RX-dropped: 0          RX-total: 156920426
TX-packets: 156920490    TX-dropped: 0          TX-total: 156920490
+++++++

Done.
testpmd>
```

6. Exit testpmd.

```
testpmd> quit
Stopping port 0...done
Stopping port 1...done
Stopping port 2...done
Stopping port 3...done
bye...
root#
```
